4-MicrosoftMalwarePrediction-RandomForest

May 22, 2020

1 Microsoft Malware Prediction

1.1 Random Forest

1.1.1 Importamos las librerías

[1]:
```
import pandas as pd
import plotly.express as px
import matplotlib.pyplot as plt
import seaborn as sns
import pickle

from sklearn.model_selection import train_test_split
from sklearn.ensemble import RandomForestClassifier
from sklearn import metrics
from sklearn.metrics import f1_score, precision_score, recall_score
from time import time
```

1.2 ——

Lectura de los datos

[ ]:
```
# Leemos los datos originales (para el submission necesitamos la variable␣
 ↪identificadora de test)

# Leemos el fichero json
import json

with open('datos/datatype.json', 'r') as myfile:
    data = myfile.read()

# Obtenemos los tipos de datos para el train
dtypes_train = json.loads(data) # Parse file

# Hacemos una copia de los tipos de datos a modificar para test
dtypes_test = dtypes_train.copy()

# Eliminamos la variable 'target'
```

```
del dtypes_test['HasDetections']

# Lectura de nuevo del conjunto de train y test, con los tipos de datos que␣
 ↪hemos definido
train = pd.read_csv("./datos/train_malware.csv", dtype = dtypes_train)
test = pd.read_csv("./datos/test_malware.csv", dtype = dtypes_test)
```

[ ]:
```
# Leemos los datos con label encoding
train_label_encoding = pd.read_csv("./datos/train_filtrado_encoding.csv")
test_label_encoding = pd.read_csv("./datos/test_filtrado_encoding.csv")
```

Partición

[ ]:
```
# Dividimos la variable target de
x = train_label_encoding.drop('HasDetections', axis=1)
y = train_label_encoding['HasDetections']
```

[ ]:
```
# Creamos el conjunto de validación
X_train, X_val, y_train, y_val = train_test_split(x, y, test_size=0.25,␣
 ↪random_state = 3)
print(X_train.shape, y_train.shape, X_val.shape, y_val.shape)
```

1.3 ——

1.3.1 Lectura del conjunto de datos particionados

[2]:
```
# Lectura del conjunto de datos particionado
X_train = pd.read_csv("./datos/X_train.csv")
X_val = pd.read_csv("./datos/X_val.csv")
y_train = pd.read_csv("./datos/y_train.csv")
y_val = pd.read_csv("./datos/y_val.csv")
```

1.3.2 Algoritmo de Random Forest

Partición 80-20

```
rf = RandomForestClassifier(criterion = 'entropy', max_depth = d, min_samples_split = 2,
                            oob_score=True, n_estimators=100)
```

	max_depth	n_estimators	tiempo (seg.)	tiempo	accuracy
1	2	100	885.1690599918	14 minutos	0.6197803525391894
2	3	100	1381.4913179874	23 minutos	0.6198293606380626
3	None	100	10573.8996510506	2.93 horas	0.6500776151519365
4	2	300	5432.5211529732	1.50 horas	0.619139828084148
5	3	300	33088.3806273937	9.19 horas	0.6200863682263399
6	2	700	6232.4242198467	1.73 horas	0.6193934165027365

Partición 75-25, `max_features = "auto"` y `min_samples_leaf = 50`

```
rf = RandomForestClassifier(criterion = 'entropy', max_depth = d, n_jobs = -1, oob_score = True
                            n_estimators = 100, max_features = "auto", min_samples_leaf = 50)`
```

	max_depth	n_estimators	tiempo (seg.)	tiempo	accuracy
1	3	100	503.1005158424	9 minutos	0.6197803525391894
2	5	100	711.5991830826	12 minutos	0.623109028203591
3	9	100	1596.7300050259	27 minutos	0.6290889280447136
4	12	100	1967.6013000011	33 minutos	0.6345728203363096
5	7	150	1880.0360009670	32 minutos	0.6274044171113486
6	4	500	3667.4405992031	1 hora	0.6211163361089393
7	6	500	5644.0747678280	1.56 horas	0.625054307811891
8	8	500	7002.1717000008	1.95 horas	0.6281078542886646

Modelo 1

[3]:
```
# Configuración del algoritmo Random Forest
rf_model_01 = RandomForestClassifier(criterion = 'entropy', max_depth = 12,␣
 ↪n_jobs = -1, oob_score = True,
                                     n_estimators = 100, max_features = "auto",␣
